Nevertheless, at present, there are only limited reports for graphene transferred onto flexible substrates, and most of these transfer graphene onto a substrate using polymethylmethacrylate (PMMA) as an intermediate membrane (14, 15). In this work, we use a simple lamination technique and report on the transfer of graphene onto a variety of flexible substrates.

Liquid Applied Roofing Systems | Johns Manville

It forms a seamless and flexible but robust waterproofing membrane and is ideal for sealing of roof details, gutters, terraces and balconies. Cold applied liquid solutions based on polyurethane resin are usually applied in two coats with or without a reinforcing fleece in between in a 'wet-on-wet' process.

Types Of Liquid Applied Waterproofing Systems

A flexible membrane is a type of semipermeable material or a material that acts as a barrier to prevent the transmission of certain substances, yet allows for the passage of others. For example, some roof coverings are flexible membranes that prevent water penetration, yet allow air passage through the roofing material.
